Headquartered in Gubbio, Perugia province. The company operates nationwide with six full-cycle plants, four terminals and three depots. The Group also operates plants and terminals in other European nations, Africa and the Caribbean, employing more than 2,000 people.

Introduction

A forward-looking Italian company active in cement production, Colacem has always been market-oriented, making technological innovation and sustainability its strong points. All supported by significant organizational know-how.

The same is true for cybersecurity. When it realized that gaining visibility of all assets-IT, OT, and IoT-was key to maintaining a strong security posture, the company turned to Armis for broader and deeper visibility within its assets, better vulnerability management, and more effective threat detection and management. Founded by the Colaiacovo family in 1966, Colacem S.p.A. has established itself as one of the leaders in the cement industry in Italy, thanks to a modern and innovative entrepreneurial culture focused on sustainability and plants constantly updated to the best technologies. Colacem is part of the Financo Group to which several companies belong, including: Colabeton, Tracem, Inba, Tourist S.p.A. (with the Park Hotel ai Cappuccini and Poggiovalle), Umbria Televisioni, Grifo Insurance Brokers and Santa Monica S.p.A., owner of the Misano World Circuit "Marco Simoncelli." The company manages information systems for all Group companies, domestic and international, for all units (cement, concrete and diversified).

Challenges

- Simplify and improve the management of IT, OT and IoT assets
- Determine the vulnerability levels of assets
- Find a way to identify and prioritize key cyber risks

Financo Group considers cybersecurity to be crucial to its operations, dedicating a team only to IT security management.

Prior to integrating Armis, the company already had an Endpoint Detection and Response (EDR) solution, along with others, on its managed assets. With its multiple operations, there was a need to have complete visibility and monitoring of the entire environment, including the OT and IoT infrastructure, something only Armis could achieve.

A single dashboard for multiple infrastructure access points

Within Colacem Spa, Armis is present in all cement plants and in the Data Center, which also exchanges information and manages locations where Armis is not directly installed.

Colacem's goal was to collect data from assets across the entire infrastructure, have a complete and single view of all managed assets and a map of their communications. For Colacem, this level of visibility is the starting point for improving the company's security posture.

Luca Salemmi, in the role of ICT Security Manager, coordinates all activities related to cybersecurity with the Information Systems and Telematics Direction team from the Gubbio headquarters and all other company locations. He approached Armis to gain complete visibility of all Colacem's assets-from IT systems to production tools.

"We requested Armis' support because we realized we did not have visibility of all the assets," comments Luca Salemmi. "What we immediately liked about the solution, and what helps us in a particular way, is the ability to also assess the level

of vulnerability of each of the assets and provide an order of priority for immediate intervention to resolve the most critical risks.”

Salemme and his team installed Armis on the core-switches of several locations, and it was integrated with existing network and security technologies: network switches, virtual infrastructure, EDR, Active Directory, and Dynamic Host Configuration Protocol (DHCP) servers. These integrations were easily implemented and added value to existing tools by enabling the exchange of valuable information and data.

Armis and the centrality of control over all systems

Since the implementation of Armis, the team has been able to assess and ensure that all OT assets, such as Programmable Logic Controllers (PLCs) and other computerized production processes, have the latest software and security updates—a critical step toward enhancing the company’s security posture. For Colacem, Armis has become a key part of managing the entire threat management component as well.

The solution continuously monitors the status and behavior of all assets on the network, looking for behavioral anomalies and potential attack indicators. Should it detect misconfigurations, policy violations, uncommon software active on the device, or improper connections, it will send an alert to the dedicated security team for them to take corrective action. Such examples might see an OT production asset connecting toward the public network or any other asset that has behavior that does not fit its defined role in the enterprise ecosystem.

The successful collaboration between Armis and Colacem already includes further developments in the near future. In

Armis Results

- Complete visibility of every connected asset
- Integration with existing infrastructure
- Single dashboard for control of all assets

less than a year, Colacem plans to work together with the Armis team to achieve compliance with the IEC 62443 standard, which defines safety requirements for IACS (industrial automation and control systems).

Misano World Circuit protection

Armis was installed at Misano World Circuit, a racetrack located near Rimini on the Adriatic Sea and known for hosting two prestigious motorcycle races.

“Inside the Misano World Circuit,” comments Luca Salemmi, “the Armis solution is used to secure and monitor technologies for track services such as telemetry, CCTV (Closed Circuit Television) and race control, electronic flags, access control systems, video surveillance for public safety, and pit box services for quick vehicle repairs and refuelling. Clearly as with all the company’s other locations, Armis also protects the office equipment, VOIP (voice-over-IP) and network server including both WIFI and LAN.”

“We requested Armis’ support because we realized we did not have visibility of all the assets. What we immediately liked about the solution, and what helps us in a particular way, is the ability to also assess the level of vulnerability of each of the assets and provide an order of priority for immediate intervention to resolve the most critical risks.”

Luca Salemmi

ICT Security Manager, Colacem S.p.A.

Armis, the asset intelligence cybersecurity company, protects the entire attack surface and manages the organization's cyber risk exposure in real time.

In a rapidly evolving, perimeter-less world Armis ensures that organizations continuously see, protect and manage all critical assets.

Armis secures Fortune 100, 200 and 500 companies as well as national governments, state and local entities to help keep critical infrastructure, economies and society stay safe and secure 24/7.

Armis is a privately held company headquartered in California.
